3. 2019101100

Relational model

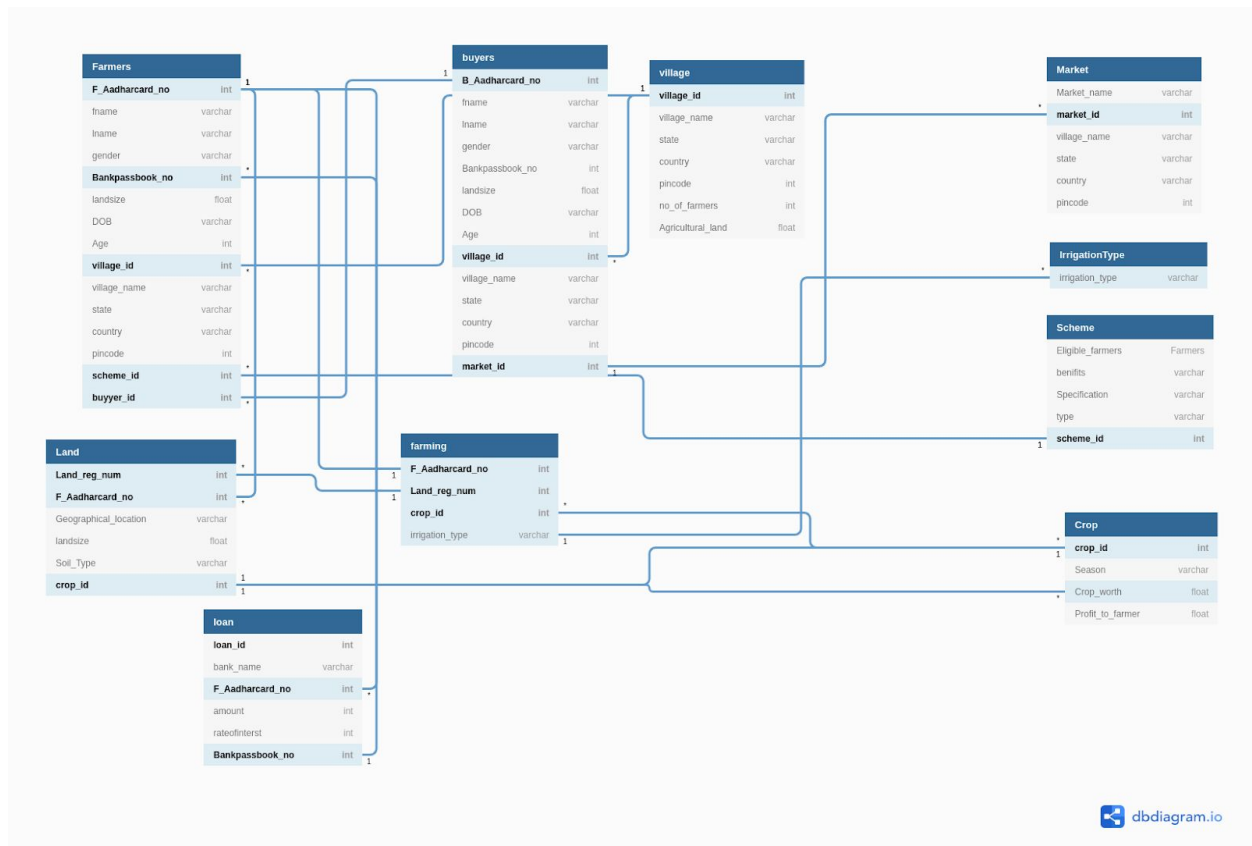

<https://dbdiagram.io/d/5f641bb57da1ea736e2e567f>

1NF

Columns have the atomic values, values of the same type and unique names/ identifiers. The changes we made here is

1. Removed composite attributes from the farmer entity type and changed it to atomic.

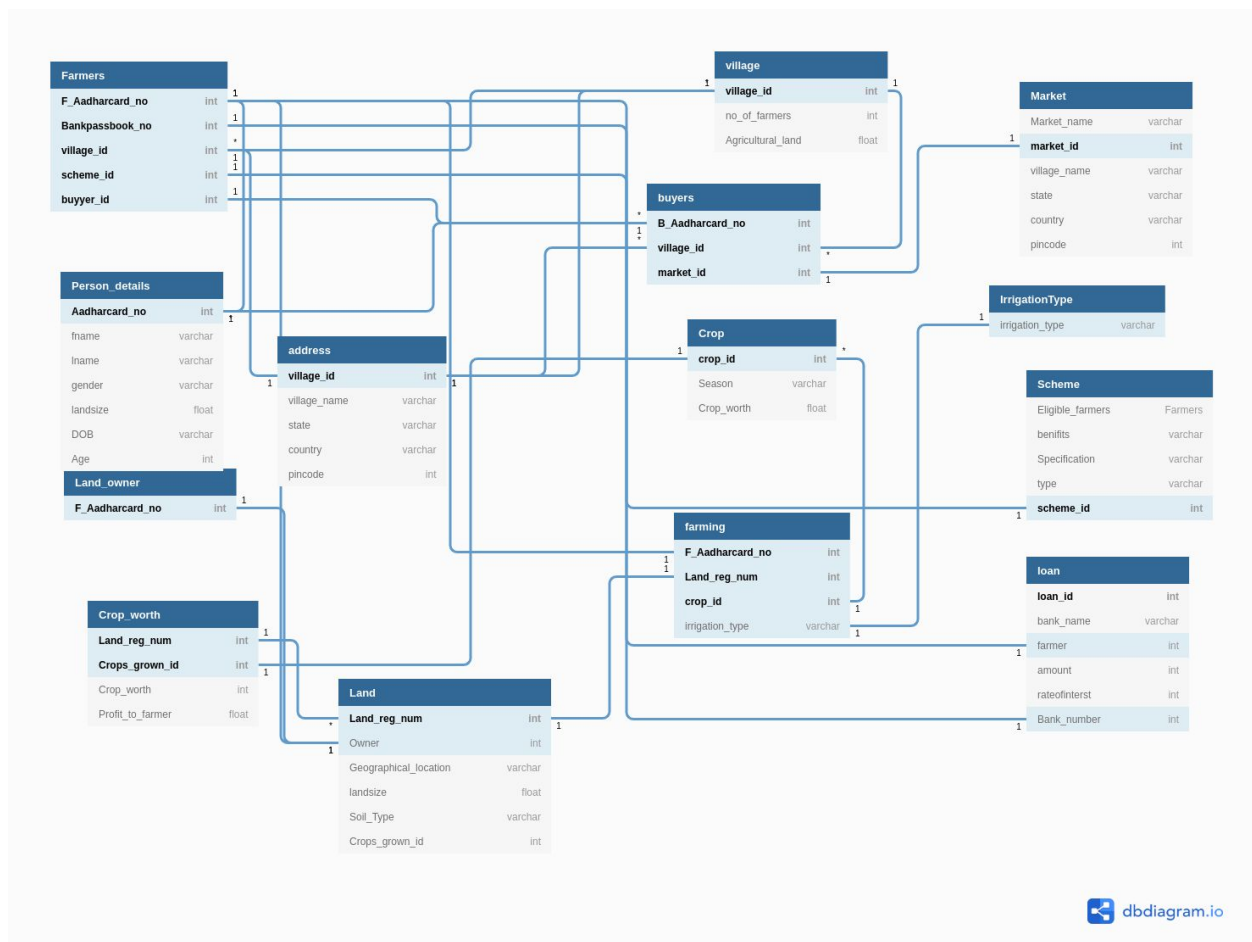

<https://dbdiagram.io/d/5f64987a7da1ea736e2e646c>

2NF

All non-prime attributes are fully functional depending on the candidate key.

Changes:

1. Separated the person details of farmer and buyer and created a separate schema to access the personal details.
2. Created a separate schema for land owner.

<https://dbdiagram.io/d/5f649f167da1ea736e2e652d>

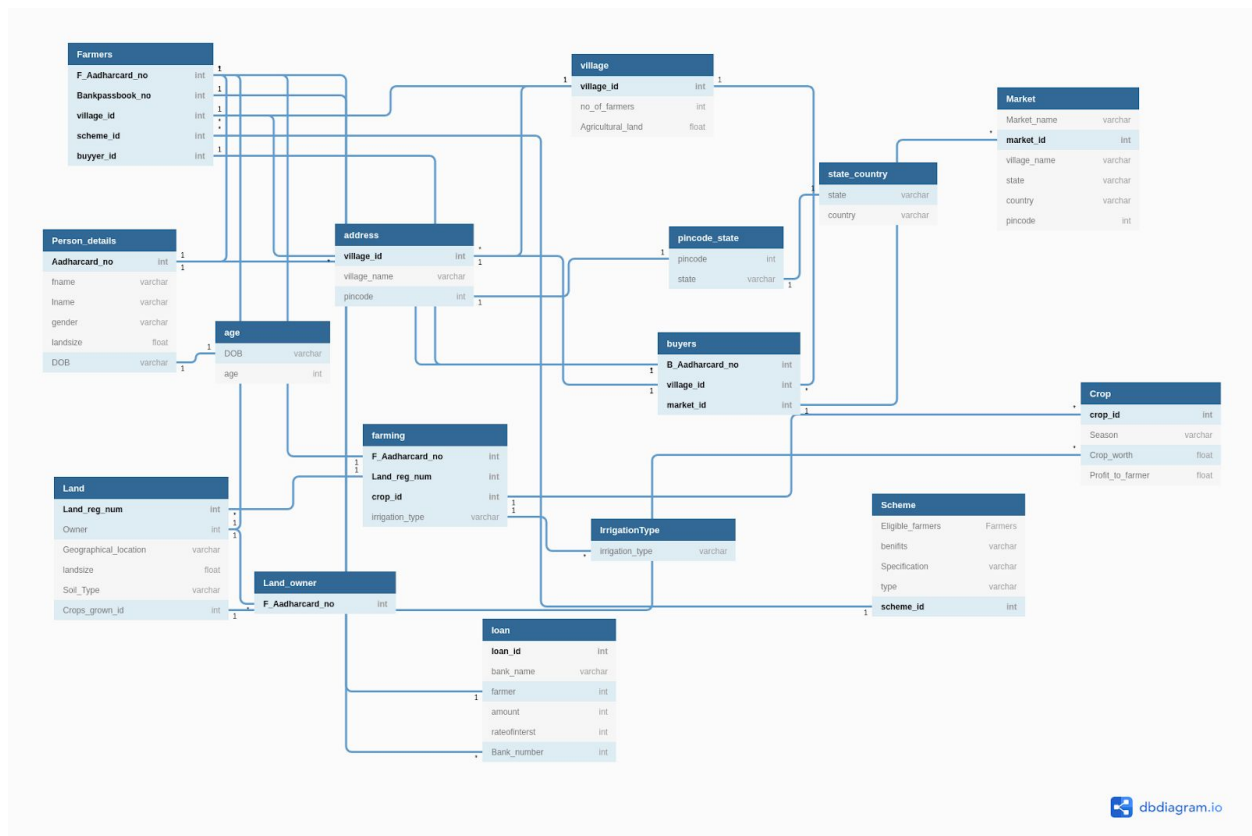

3NF:

Transitive independency

Changes:

Removed Transitive dependency in two cases:

1. In person_details schema, DOB depends on age but it doesn't depend on the aadhar card no of the person.
 2. In the Address schema, state depends on country, pincode depends on village.
- so, we divided it into separate schemas.
